

SHOWERMISER OPERATION GUIDE

1. Make sure hot water system (Tank or Tankless) is on and operating correctly.
2. If not on City hook ups make sure water pump is on.
3. Determine the correct positions for the SHOWERMISER diverter valve: a) Position #1 sends the water to the shower head. b) Position #2 sends the water through the blue tube or mushroom (depending on your model) back to the freshwater tank.
4. Turn the diverter valve knob to position # 2.
5. Turn the hot water on to the full position. Note: no water will come out of the shower head, but you will hear water running.
6. Keep your eye on the blue tube (or mushroom) once the hot water has arrived it will start to turn from blue to white.
7. Once the hot water is now flowing through the SHOWERMISER turn down the hot water and add cold water until your preferred hot and cold water mix is reached In the beginning you will not know exactly where the proper position of the hot and cold water valves should be placed but you will learn (maybe even mark the valves with a small dot) the correct position with a little experimentation.
8. Turn the SHOWERMISER diverter knob to position #1. water will now flow from the water head.
9. Once you are completely wet, again turn the SHOWERMISER diverter knob back to position #2. You can now wash your hair, soap up and know you are not wasting water and the water temperature will be the same when you are ready to rinse off.
10. Once you are ready to rinse off turn the SHOWERMISER diverter knob back to position #1.
11. Shut off water valves when finished.
12. Note: to avoid wasted drips and leaks from the shower head it is suggested you keep the SHOWERMISER valve in position #2 when the shower is not in use.
13. turn the SHOWERMISER diverter knob back to position #2.
